The Science of Design

# THE CHAMELEON® II

The sleek, inconspicuous design of the Chameleon® is an asset to pet owners and to working dog handlers. No one does see that the Chameleon® is an electronic collar. The public does not see the Chameleon® as anything more than a nice looking collar around the neck. There is no tell tale “brickstone”. Currently, [www.bartbellonshop.com](http://www.bartbellonshop.com) sells the Chameleon® with a Perfect Fit closure. Other closure options are available to purchase as an accessory.

The Chameleon® is a collar that acts as a chameleon: it can adapt immediately to the legal and visual constraints. As a user, you and your dog assimilate perfectly in whatever environment you are.

## 1. THE CHAMELEON® IS A DOUBLE CONTACT ELECTRONIC COLLAR RECEIVER

- The Chameleon® functions as if there are two receivers that are around the neck of the dog.

## 2. CONTACT POINTS CAN BE MOVED

- Minimize necrosis
- Minimize desensitization

## 3. THE LIGHTWEIGHT SLEEK DESIGN DOES NOT HANG AT THE THROAT OF THE DOG LIKE THE BRICKSTONE COLLAR SYSTEMS

## 4. THE CHAMELEON® IS A COLLAR RECEIVER

- The Chameleon® patent is a mechanical design that can be made with different electronics

## 5. THE CHAMELEON® IS COMPATIBLE WITH THE TRANSMITTERS FROM MARTIN SYSTEMS (TT100, TT200, TT400, TT1000, PT3000 AND PT3004)

- All Chameleon® receivers are equipped with Stimulation à Sensation Constant (SSC) which is Patented by Martin Systems. This means that the receiver is constantly measuring the conditions of the skin from the dog to be certain that the sensation felt by the dog is constant at a certain level regardless of changes in resistance or impedance. This is very important if you train in the water or under extreme weather conditions. Example: you cannot overstimulate your dog by accident when he

comes out of the water because the S.S.C. receiver automatically reduces the stimulation to make sure that level 4 is still felt as level 4 without the user having to turn the level lower.

- All Chameleon® receivers are equipped with a contact measurement feature: the Chameleon® LED communicates whether or not there is contact. No contact is the number one cause of accidental overstimulation. More options for checking for contact available with the use of USB Emily
- The Chameleon® Collar Receiver has continuous stimulation until level 10 and pulsating stimulation at level 11 and above. This can be changed using USB Emily.
- There are 4 different default modes when used with the PT3000 transmitter:
  - Clicker
  - Stimulation (flash/ nick, continuous and rising)
  - Sound (tone) with vibration and stimulation (flash/ nick, continuous and rising)
  - Warning tone and vibration (auditory signal with no stimulation but with vibration) followed by sound, vibration, and continuous stimulation

## 6. THE CHAMELEON® IS COMPATIBLE WITH THE PT3000 TO WHICH YOU CAN PAIR A FINGER-KICK (A BLUETOOTH RING THAT FITS AROUND YOUR FINGER)

- Hands free control of your transmitter

## 7. THE CHAMELEON® IS COMPATIBLE WITH USB EMILY WHICH ENABLES CUSTOMIZATION OF FEATURES OF YOUR RECEIVER

- With the push of a button, all stimulation is deleted and you have a vibrate and tone collar
- type of electricity at certain levels or all levels can be changed
- Change parameters for checking for contact
- Change LED lights, sound, vibration, and more...

# THE CHAMELEON® II SINGLE CONTACT

Chameleon® II collars are now available for smaller neck sizes

- Chameleon® Single Contact is 30 cm in length
- Chameleon® Double Contact is 37 cm in length

By double contact, we mean that the Chameleon® functions as a collar system with two receivers that can be spaced on either side to create balance from stimulation as some dogs will move away from the stimulation if it is only on one side. There are two negative and two positive islands on each side of the collar on the Chameleon® double contact receivers. Each island has the possible of three different positions to put contact points.

By single contact we mean that there is only a positive island on one side and a negative

island on the other side. This is the same technology as the standard Chameleon® II but is offered here with two fewer islands so that the collar can fit dogs with a small neck circumference.

Both the Chameleon® II double contact and the Chameleon® II single contact include the possibilities to move contact points to minimise necrosis and desensitization. Both include all the benefits of the patented Stimulation à Sensation Constant (SSC) and contact measurement. Both are compatible with the PT3000 which can be paired to the Finger-Kick and give hands free control of the transmitter. Both the Chameleon® II double contact and the Chameleon® II single contact are compatible with multiple transmitters by Martin Systems.

The Chameleon® II maintains its sleek and inconspicuous design that allows you to enjoy your training and not questions about your collar.
